

## PLANNING THE PROPER SPACE FOR WASTE COLLECTION

Plan space for dumpsters with adequate access for users and for collection vehicles.

- In order to service the dumpster, the truck needs 50 feet of access and should not have any overhead hazardous (i.e. wires and tree branches).
- Standard 209 inch wheelbase truck (i.e. Roll-off) has a turning radius of 40 feet, curb to curb diameter is 83 feet, and wall to wall diameter is 88 feet.
- Container pad must be able to withstand 55,000 to 60,000 pounds. General concrete pad specs for roll-off containers are to be 10' wide, at a minimum 5' longer than the container. Concrete must be a minimum of 3000psi, steel reinforced, and 6" thick.
